

# Compartment Review Presentation

## Traverse City Forest Management Unit

Compartment 61035

Entry Year 2026

Acreage: 2,762

County Manistee

Management Area: Grand Traverse Moraine

---

**Stand Examiner:** Joe Ventimiglia

### Legal Description:

T24N, R14W, sections: 20, 21, 28, 29, 32, 33

### Identified Planning Goals:

This compartment is designated as mixed use in the Regional State Forest Management Plan and more specifically the Manistee River Management Area guidance. This designation places equal importance on the production of wood fiber, wildlife habitat, recreation and scenic and aesthetic values.

### Soil and topography:

Major soil types for this Compartment include Roscommon-AuGres-Croswell - poorly drained sands; Montcalm-McBride-Kalkaska, Kalkaska-Rubicon - deep, droughty sands; Carlisle-Carbondale-Karston - mucks; Saigatuck - somewhat poorly drained. Terrain is level to gently rolling.

### Ownership Patterns, Development, and Land Use in and Around the Compartment:

Compartment 35 of the Manistee River MA is a fairly solid block of state ownership in northern Manistee County. State ownership within the compartment is contiguous with the exception of 2 isolated private parcels located in the northern 2 sections of the compartment. The perimeter of the compartment alternates between state and private land interface.

### Unique Natural Features:

Bear Creek and Lemon Creek flow through the compartment. Healy Lake is located in the southeast corner of the compartment in Section 33.

### Archeological, Historical, and Cultural Features:

There are known concerns within the compartment. All proposed management activities have taken these concerns into consideration.

### Special Management Designations or Considerations:

Use of appropriate buffers along Bear and Lemon Creek. These are not designated natural rivers but are protected as if they were.

### Watershed and Fisheries Considerations:

Bear Creek, Lemon Creek, the Healy Lake Outlet and a number of smaller tributaries flow through Compartment 35. All are Designated Trout Streams. Bear Creek has self-sustaining populations of brook trout, brown trout, steelhead, coho salmon, and chinook salmon. Lemon Creek has a self-sustaining population of brook trout, and also supports seasonal runs of salmon and steelhead. No trout or salmon are stocked in any of these streams. Because these streams support populations of wild trout and salmon, they require the utmost protection. Aspen clear cuts close to small trout streams create conditions ripe for beaver over-colonization and resulting habitat degradation, including erosion, sedimentation, blocked fish passage, and warming of the water.

### Wildlife Habitat Considerations:

This compartment falls on a flat lake plains landscape, characterized by loamy sands and relatively flat terrain. The presettlement forest cover in this landscape was dominated by beech-maple and white pine-beech-red maple forests. The compartment today is dominated by pine plantations, aspen-hardwood mixes on moist to wet soils, and some wetlands and remnant fields. This landscape is less fire-prone than the outwash plains to the north. GLO surveyors reported large wind throw areas which were perhaps the dominant natural change factor, along with natural succession.

Well advanced forest stands adjacent to the river should be maintained as late successional forest for riparian habitat and as a remnant of historic forest cover. Mink, barred owls, pileated woodpeckers, wood frogs, deer, and numerous other species will benefit from such cover. These areas are also important for the state-special concern, red-shouldered hawk.

Low lying aspen and shrub stands are abundant in sections 29 and 32. Maintaining a variety of aspen age classes here through periodic cutting will benefit numerous species such as ruffed grouse, woodcock, golden-winged warbler, and black bear. Harvests should incorporate leave trees, snags, and creation of some down logs. Wild raisin, chokeberry, and blueberry are particularly abundant in this area and provide an extremely important soft mast resource. Patches of old

white pine offer important diversity and should be maintained. Red-shouldered hawks are also known to use this area. Any nesting sites discovered should be protected following Department guidelines.

Most of the rest of the state lands in the compartment are fragmented parcels with pine plantations, remnant fields, and small stands of hardwoods. Any thinnings can only benefit wildlife by allowing some sunlight into these stands which will in turn diversify ground flora and habitat. Wetlands should be buffered when thinning adjacent stands. Openings should be maintained where they exist to enhance local diversity for deer, turkey, cedar waxwing, red fox, American goldfinch, and other species using open habitats.

### **Mineral Resource and Development Concerns and/or Restrictions**

There is no known metallic mineral potential in this part of the state. No known active sand/gravel pits exist in the area. Due to the lack of upland property (i.e., shallow water table) and the prevalence of oil & gas infrastructure, potential for commercial development of sand & gravel within the compartment appears to be low. The compartment is within the Antrim Shale and northern Silurian reef hydrocarbon plays. Much of the compartment has seen oil & gas development, and much of the mineral rights in the compartment are currently leased and held by production.

### **Vehicle Access:**

The road along the east edge of section 29 that also serves as the snowmobile trail has several low, muddy spots that collect water. Clean fill and gravel should be placed and spread to repair this stretch of road/snowmobile trail. The undesignated boat access site on the north end of Healy Lake which receives a moderate amount of use should be graveled and seeded to minimize sand run-off into Healy Lake.

### **Survey Needs:**

None at this time.

### **Recreational Facilities and Opportunities:**

The Bear Lake Spur of the Betsie Valley Snowmobile Trail crosses the compartment. Snowmobile trail protection specifications should be added to the timber sale contract where treatments will impact the trail system. Healy Lake Campground, operated by Springdale Township is located on the east side of Healy Lake, just outside of the compartment boundary. Remnant paint marks from the Crokey Lake Pathway, abandoned by FRD, can still be seen in sections 28 and 33. There is an undesignated boat launch site on the north end of Healy Lake. This site receives a fair amount of use which is resulting in some erosion of the slope into the lake. Dispersed recreation is common throughout the compartment during the firearms deer season. There are also numerous access points utilized by anglers along Bear Creek throughout the year, but these sites receive increased use during salmon and steelhead runs. (T.M.N. 4/14/14)

### **Fire Protection:**

Copemish-Cleon Volunteer Fire Department, Department of Natural Resources coverage provided from the Traverse City Management Unit.

### **Additional Compartment Information:**

The following reports from the Inventory are attached:

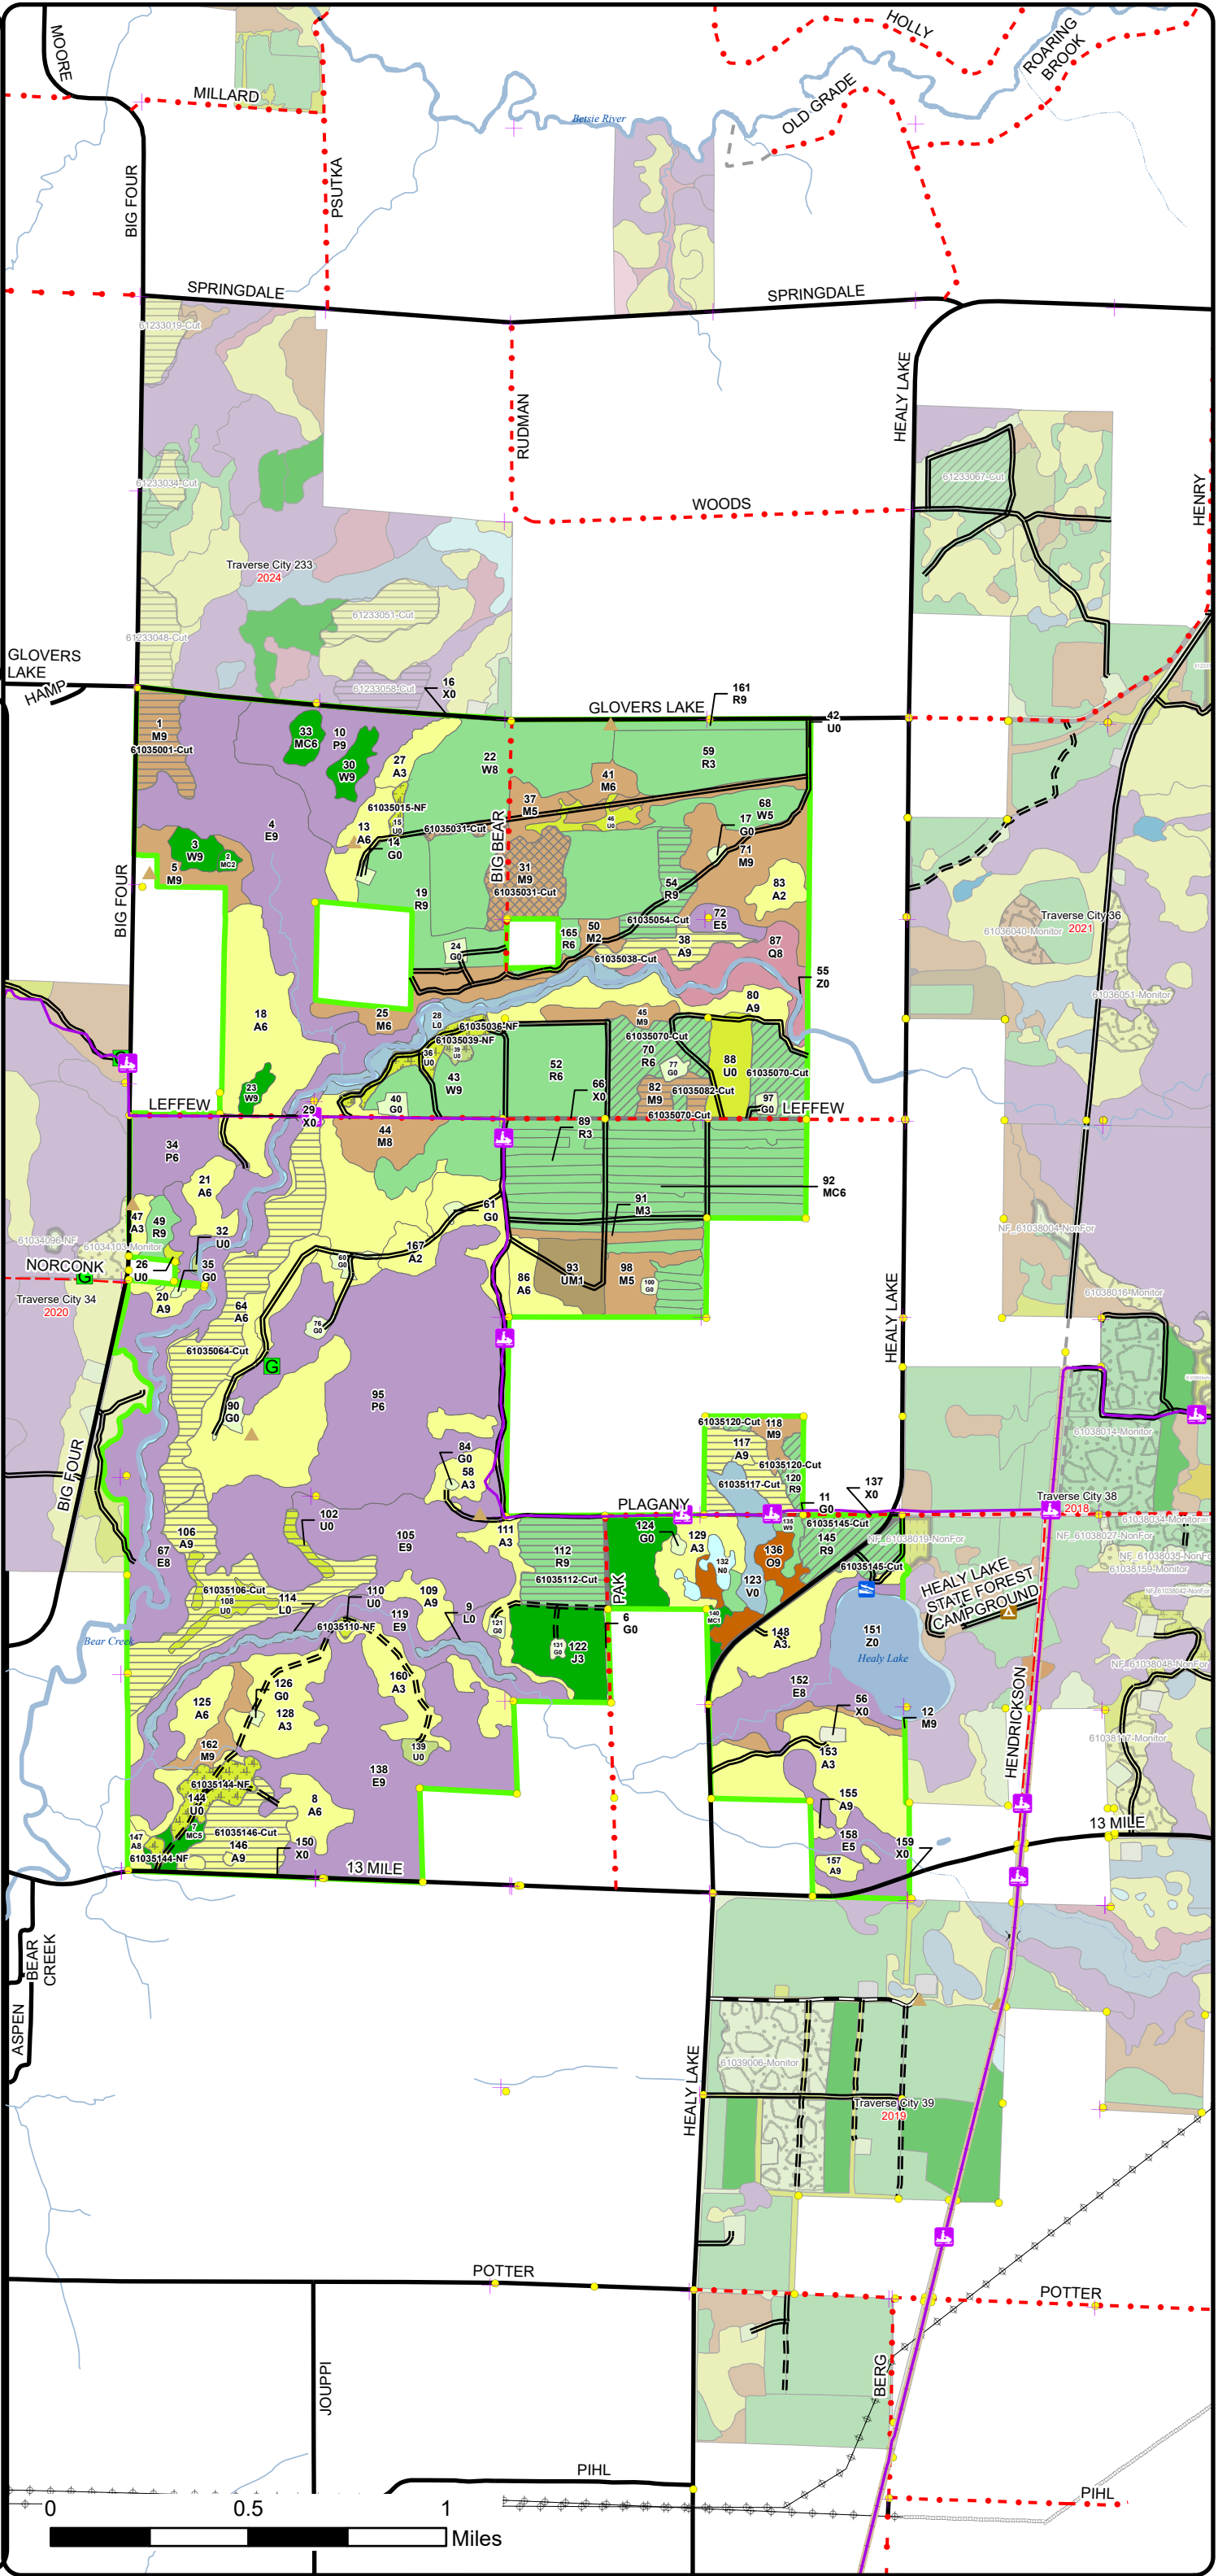

- Total Acres by Cover Type and Age Class**
- Cover Type by Harvest Method**
- Proposed Treatments – No Limiting Factors**
- Proposed Treatments – With Limiting Factors**
- Stand Details (Forested and Nonforested)**
- Dedicated and Proposed Special Conservation Areas**
- Site Condition Details**

The following information is displayed, where pertinent, on the attached compartment maps:

- Base feature information, stand boundaries, cover types, and numbers**
- Proposed treatments**
- Site condition boundaries**
- Details on the road access system**

### Report 5 – PROPOSED SPECIAL CONSERVATION AREA\* (SCA) DETAILS

\* This is a partial list of SCAs for this compartment. Not included are those areas identified under other Department initiatives (Natural Rivers, Deer Wintering Areas, etc.). Those will be identified in separate, future map and report products.

SCA Name	SCA Category	Detail Type	Recommendation	Acres
Unspecified Comments	Spring Wetlands Riparian Area	Spring Seep	SCA	106

**Report 6 – EXISTING SPECIAL CONSERVATION AREA DETAILS**

\* This is a list of SCA's for this compartment along with a 1/4 mile buffer surrounding the compartment. Refer to the Special Conservation Area Map for locations of the below listed Conservation Areas.

ERA = Ecological Reference Area  
 HCVA = High Conservation Value Area  
 SCA = Special Conservation Area

Conservation Area	Type	Description
SCA	Cold Water Lake	A coldwater lake has temperature and dissolved oxygen conditions that allow naturally-reproduced or stocked trout populations and those of other coldwater fish species to persist from year to year. Suitable conditions for coldwater fishes may occur in Michigan lakes if they are relatively deep, have substantial groundwater inflows, or are located in colder (northern) areas of the state. Such lakes are established by Director's action and designated as trout resources by Fisheries Order 200.
SCA	Cold Water Stream	A coldwater stream has temperature and dissolved oxygen conditions that allow naturally-reproduced or stocked trout populations and those of other coldwater fish species (e.g., slimy sculpin) to persist from year to year. Coldwater streams in Michigan typically provide these conditions due to substantial contributions of groundwater to their stream flows. Such streams are established by Director's action and designated as trout resources by Fisheries Order 210.
SCA	Riparian Area	A transitional area between aquatic and terrestrial ecosystems in which the terrestrial ecosystem influences the aquatic ecosystem and vice-versa. Because of the unique conditions adjacent to lakes, streams and open water wetlands, riparian areas harbor a high diversity of plants and wildlife. Riparian communities are ecologically and socially significant in their effects on water quality and quantity, as well as aesthetics, habitat, bank stability, timber production, and their contribution to overall biodiversity.

4	6113 - Lowland Maple	Sawtimber Well	102.2	117	81-110	N/A	Large lowland maple stand. Standing water at most times of year based on the season. Stand does have a few upland slivers in south end but nothing continuous enough to be mapped. Lots of large blowdown in stand.  Portions of stand was set in the 1980s to be clearcut but never happen. I'm assuming at a result of being too wet.

OLD COMMENTS- Mixed stand with aspen being dominant. Red maple present in descent numbers along with pockets of cedar, hemlock and black ash throughout. Stand is wet with standing water present throughout much of stand at time of inventory. Southern edge of stand contains some springs leading to Lemon creek which have definitive flow to them. Pockets of stand are upland however these remain very difficult to access without causing significant rutting damage. Some ORV damage has been caused along old trail leading from southern end of access road within stand 64, rutting remains and is quite deep. (old comment) stand is generally lowland with some minor upland inclusions
