

Compartment Review Presentation

Sault Ste. Marie Forest Management Unit

Compartment 45105

Entry Year: 2027

Acreage: 1,916

County: Mackinac

Management Area: St. Ignace Lake Plain

Stand Examiner: Nate Plato

Legal Description:

T43N-R6W Section 22 - 24, Moran Township.

Identified Planning Goals:

The compartment is located 5 ½ miles north of Brevort and 5 ½ miles south of Trout Lake on the Carp River Truck Trail, Caffey and Dells Mills Roads. The compartment is composed of a variety of lowland and upland types and species. The eastern half of the compartment is mostly upland types of red pine, aspen, upland brush and grassy openings. The western half of the compartment is mostly upland types of northern hardwood, aspen, upland brush and grassy openings. The lowland types are cedar, hemlock and mixed swamp conifers with some ponds and marsh areas. The Carp River flows through Section 24. The Carp River is designated as a wild and scenic in the stretch downstream on the Hiawatha National Forest. The South Branch of Carp River flows through Section 22 and the south west corner of Section 23. The red pine stands within the compartment are being managed according to the red pine management guidelines and other available resources. Some of the red pine will be final harvested to gain age class distribution in the red pine within the compartment and the surrounding lands. There will also be an intermediate red pine thinning and first thinning. Other treatments include multiple hardwood thinnings, a hemlock shelterwood and an aspen final harvest. The young red pine stands will be monitored for regeneration, release needs, and insect and disease infestations. The area is heavily used by recreationists.

Soil and topography:

The majority of the compartment is on the outwash plain and lake plains on level to undulating ground. The higher ground soils are mostly Wallace Sand with Paquin Sand, and Paquin-Finch complex on the ridges in the lowland areas. The transition areas have Spot-Finch Complex and Finch Sand. The lowland areas mostly have the Markey-Spot-Finch Complex with some higher transition areas to the Paquin Sand and Wallace Sand. The other lowland soil types are Markey and Carbondale Muck, Finch-Dawson-Pullup Complex, Leafriver Mucky Peat, Leafriver-Croswell-Wainola Complex, Dinkey Muck in the Carp River and flooded Entisols are intermixed along the South Branch of Carp River drainages.

Ownership Patterns, Development, and Land Use in and Around the Compartment:

The north, west and south sections surrounding the compartment are in state ownership. The sections to the east, northeast, and southeast are in federal ownership on the Hiawatha National Forest.

Unique Natural Features:

Potential for raptors and Great Blue Herons to nest in the compartment exists and care will be taken to check stands for nests and take appropriate management action to protect the species. Northern Fen has been identified in the compartment. Any management in the surrounding area will follow the MNFI recommendations to protect the integrity of the Northern Fen. There is a potential for some rare, threatened, and special concern plant and animal species to inhabit the compartment. Stands to be managed will be checked for species of concern. Management will be modified if species are found within those stands per management guidelines for that species.

Archeological, Historical, and Cultural Features:

Most of the red pine plantation in this and adjacent compartments were originally planted in the 1930's under the Civilian Conservation Corp program. The Carp River was used for river log drives in the early lumbering days.

Special Management Designations or Considerations:

The Carp River has undergone stream bank restoration projects to reduce the amount of siltation into the river from the sandbanks. Conifer will be encouraged within the aspen stands along the banks of the Carp River and South Branch of Carp River and tributaries to decrease the amount of beaver habitat along the river. Snowmobile and ORV trails will need to have specifications in the timber sale contracts to protect the trail and provide for safety precautions around the trails.

Watershed and Fisheries Considerations:

This compartment is within the Carp River watershed, and contains portions of the Carp River, the South Branch of the Carp River, and some unnamed tributaries to the South Branch. All of these streams are Michigan Designated Trout Streams. This watershed supports populations of resident brown trout and brook trout, as well as anadromous species such as chinook salmon, pink salmon, coho salmon, and steelhead. Prescribed management activities are appropriate for

the protection of these waterbodies.

Wildlife Habitat Considerations:

This compartment is part of the St. Ignace Lake Plain Management Area where featured wildlife species include American marten, American woodcock, black bear, blackburnian warbler, black-throated blue warbler, ruffed grouse, sharp-tailed grouse, snowshoe hare, and white-tailed deer. In the western part of the compartment, northern hardwood or maple-dominated stands are common followed by lowland conifers and aspen. Some hemlock stands are present, and hemlock is a component of some maple-dominated stands. Red pine plantations make up much of the eastern side of the compartment with aspen, mixed conifer, and jack pine stands being less common. Branches of the Carp River run through the compartment. Diversity will be maintained and encouraged in hardwoods by promoting young growth while maintaining some mature trees as well as structural and species diversity, including retaining and encouraging hemlock. The actions should benefit blackburnian warbler and black-throated blue warbler, although in varying locations. Final harvests in red pine and some other types in the vicinity will provide temporary openings that will benefit sharp-tailed grouse and other species that rely upon openings. As they regenerate, they will provide cover for snowshoe hare. Stream corridors and wetlands will be protected to maintain their integrity. Lowland conifer habitat will be retained and will provide cover for hare and other wildlife.

Mineral Resource and Development Concerns and/or Restrictions

No known potential exists for commercial oil & gas production in this part of the state, and there is no known potential for economic production of metallic minerals in this area. The closest known active aggregate operation is the Ozark Quarry, less two miles northeast, which produces crushed stone from bedrock dolostone and perhaps sand & gravel from thin overlying glacial drift. High-purity dolomite also exists beneath the compartment but is likely at a greater depth and, in conjunction with the more remote location of the compartment and prevalence of wetlands, potential for commercial development is considered minimal. The State does not own all the mineral rights within the compartment. Because the mineral estate is the dominant estate, the surface owner must provide the owner of the mineral rights reasonable access to the surface for mineral exploration and development.

Vehicle Access:

This compartment has very good access except for the portion of Section 24 on the east side of the Carp River. No roads extend from the north into this portion of the compartment. The Ozark Creek is just on the east side of the Section 24 boundary. The area prescribed for management has a small volume of available products to remove. This will make harvesting these stands more difficult. The access from the Carp River Truck Trail, Caffey and Dells Mills Roads is very good which are all DNR roads. The Dells Mills Road is in good condition with some maintenance completed in the past except the western portion from the Caffey Road west across the section line. The road is drivable but is in need of grading and graveling. The Carp River Truck Trail and Caffey Road are in good shape except for the sandy areas of the roads in the very dry period in the summer. Periodic maintenance has been completed on both roads within the last 5 years with timber sale contract work and road and bridge funding on the south end of the Carp River Truck Trail. The two tracks are in good shape most of time with a few water holes - these should remain open.

Survey Needs:

No new survey projects are required for this compartment with adequate corners present.

Recreational Facilities and Opportunities:

The Carp River Truck Trail, Dells Mills Road, and Caffey Road are used as snowmobile trails and part of the ORV trail runs on the Caffey and Dells Mills Roads. The compartment is heavily used for all types of recreational activities including motorized vehicle use, fishing, hunting, trapping, berry picking and nature viewing.

Fire Protection:

The eastern half of the compartment has a potential for a moderate to higher intensity fire in the red pine area. The Thunder Alley Fire burned in 1999 through a portion of the compartment to the north. The west portion has lower fire intensity potential with the hardwood stands and lowlands. The problem of ground fire does exist in this portion of the compartment.

Additional Compartment Information:

None.
